

Technical Assessment for MERN Stack Developer

Objective:

Build a full-stack web application that replicates a simple Job Board Platform using the MERN stack.

Task Overview:

Your task is to develop a responsive job board homepage where users can:

View a list of job postings.

Submit a job via a form (handled via backend API).

Filter jobs by category (e.g., Design, Development, Marketing).

Key Requirements:

Frontend (React):

Header Section:

Include logo placeholder, navigation (e.g., Home, Jobs, Contact), and a "Post a Job" button.

Hero Section:

Heading: "Find Your Dream Job."

Subheading and a search input for job titles or companies.

Job Listings Section:

Display job cards with title, company name, category, and location.

Add filtering by job category.

Job data should be fetched from your backend API.

Post a Job Form:

A form with inputs: Job Title, Company Name, Category (dropdown), Location, and Description.

On submission, send data to the backend and refresh the job list.

Footer Section:

Include contact info, links, and social icons.

Backend (Node.js + Express):

Set up basic routes:

GET /jobs – Return a list of job postings.

POST /jobs – Accept job submissions.

Use in-memory storage or MongoDB (bonus points if MongoDB is integrated).

Tech Requirements:

Frontend: React, functional components, hooks.

Backend: Node.js, Express (MongoDB optional).

Styling: CSS modules, Tailwind, or styled-components.

Responsiveness: Must work on desktop, tablet, and mobile.

Code Quality: Component reusability, clean structure, and comments where necessary.

Assessment Criteria:

Functional UI with proper responsiveness.

Working form with backend integration.

Clean and modular code.

Basic filtering logic.

README with setup instructions.

Submission:

Submit your project within 48 hours

Upload to GitHub and share the repository link.

Include clear instructions to run frontend and backend locally.

You may use placeholder logos and icons.
